Comp 555 - BioAlaorithms - Spring 2018

• PROBLEM SET #2 IS LATE, BUT STILL COMING

The Realities of Genome Assembly

From Last Time

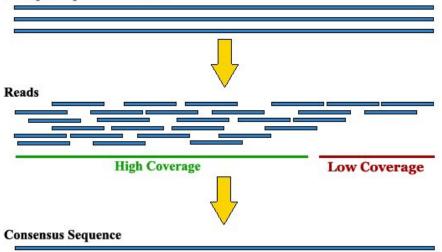

What we learned from a related "Minimal Superstring" problem

- Can be constructed by finding a Hamiltonian path of an k-dimensional De Bruijn graph over σ symbols
 - Brute-force method is explores all V! paths through V vertices
 - Branch-and-Bound method considers only paths composed of edges in the graph
 - Finding a Hamiltonian path is an NP-complete problem
 - There is no known method that can solve it efficiently as the number of vertices grows
- Can be constructed by finding a Eulerian path of a (k-1)-dimensional De Bruijn graph where k-mers are edges.
 - Euler's method finds a path using all edges in $O(E) \le O(V^2)$ steps
 - Graph must statisfy contraints to be sure that a solution exists
- All but two vertices must be balanced
- The other two must be semi-balanced

Applications to Assembling Genomes

Multiple Copies of a Genome

- Extracted DNA is broken into random small fragments
- 100-200 bases are read from one or both ends of the fragment
- Typically, each base of the genome is covered by 10x 30x fragments

Genome Assembly vs Minimal Superstring

binary3 = {'000', '001', '010', '011', '100', '101', '110', '111'}

	101 100		111 100
	001 111		001 101
Solution #1:	0001011100	Solution #2:	0001110100
	000 011		000 110
	010 110		011 010

- Mininmal substring problem
 - Every k-mer is known and used as a vertex, (all σ^k)
 - Paths, and there may be multiple, are solutions
- Read fragments
 - No guarantee that we will see every k-mer
 - Can't disambiguate repeats

Recall our "Toy" example

GACGGCGGCGCACGGCGCAA GACGG CGCAC ACGGC GCACG	- Our <i>toy</i> 20 base sequence from 2 lectures ago
CGGCG CACGG GGCGG <mark>ACGGC</mark> GCGGC CGGCG	- The complete set of 16 5-mers
CGGCG GGCGC	
GGCGC GCGCA	
GGCGA CGCAA	

- All *k-mers* is equivalent to *k*× coverage, ignoring boundaries
- Four repeated k-mers {ACGGC, CGGCG, GCGCA, GGCGC}

Some Code

First let's add a function to uniquely label repeated k-mers

['ACGGC_1', 'ACGGC_2', 'CACGG', 'CGCAA', 'CGCAC', 'CGGCG_1', 'CGGCG_2', 'CGGCG_3', 'GACGG', 'GCACG', 'GCGCA_1', 'GCGCA_2', 'GCGGC', 'GGCGC_1', 'GGCGC_2', 'GGCGGG']

Our Graph class from last lecture

def eulerianPath(self):

In [25]: import itertools

class Graph: def init (self, vlist=[""" Initialize a Graph self.index = {v:i for self.vertex = {i:v for self.edge = [] self.edgelabel = [] def addVertex(self, label) """ Add a labeled vert index = len(self.index self.index[label] = in self.vertex[index] = 1 def addEdge(self, vsrc, vd """ Add a directed edg Repeated edges are dis e = (self.index[vsrc], if (repeats) or (e not self.edge.append(e self.edgelabel.app def hamiltonianPath(self): """ A Brute-force meth Basically, all possibl for edges. Since edges made for *which* versi for path in itertools. for i in xrange(le if ((path[i],p break else: return [self.v return [] def SearchTree(self, path. """ A recursive Branch Paths are extended one edges from the graph. if (len(verticesLeft) self.PathV2result return True for v in verticesLeft:

if (len(path) == 0 if self.Search return Tru

return False

Comp 555 - Fall 2019

""" A wrapper funct Hamiltonian Path se self.PathV2result = self.SearchTree([], return self.PathV2r def degrees(self): """ Returns two dic of each node from t inDegree = {} outDegree = {} for src, dst in sel outDegree[src] inDegree[dst] = return inDegree, ou def verifyAndGetStart(s inDegree, outDegree start = 0 end = 0for vert in self.ve ins = inDegree. outs = outDegre if (ins == outs continue elif (ins - out

Finding Paths in our K-mer De Bruijn Graphs

In [8]: ▶ k = 5

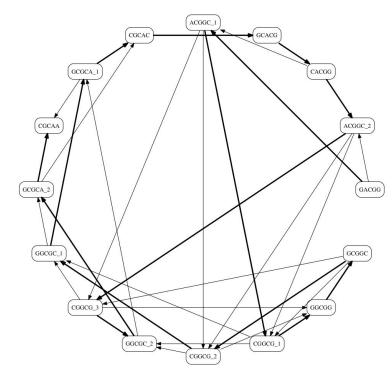

```
target = "GACGGCGCGCGCGCGCGCAA"
kmers = kmersUnique(target, k)
G1 = Graph(kmers)
for vsrc in kmers:
    for vdst in kmers:
        if (vsrc[1:k] == vdst[0:k-1]):
            G1.addEdge(vsrc,vdst)
path = G1.hamiltonianPathV2()
print(path)
seq = path[0][0:k]
for kmer in path[1:]:
    seq += kmer[k-1]
print(seq)
print(seq == target)
['GACGG', 'ACGGC 1', 'CGGCG 1', 'GCGCG 1', 'GCGCA 1', 'CGCAC', 'GCACG', 'CACGG', 'ACGGC 2', 'CGGCG 2', 'GGCGG', 'GCGGC', 'CG
GCG 3', 'GGCGC 2', 'GCGCA 2', 'CGCAA']
GACGGCGCACGGCGGCGCAA
```

Not the sequence we expected ...

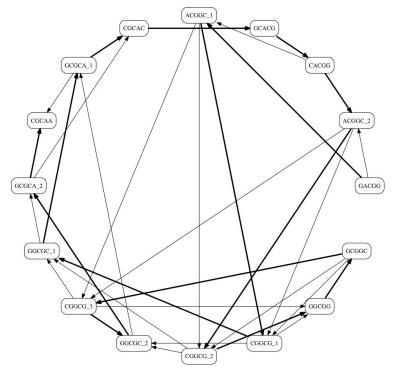

False

Let's look at the resulting graphs

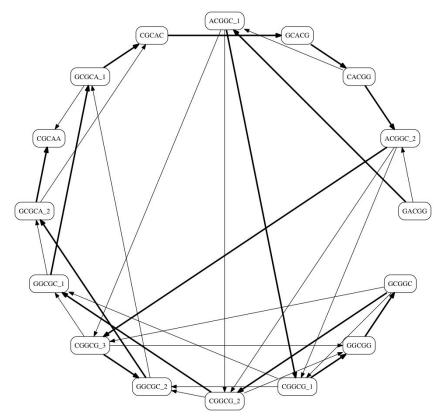

The one we hoped for. Visits CGGCG₃ before CGGCG₂

The one we found visits CGGCG₂ before CGGCG₃

What's the Problem?

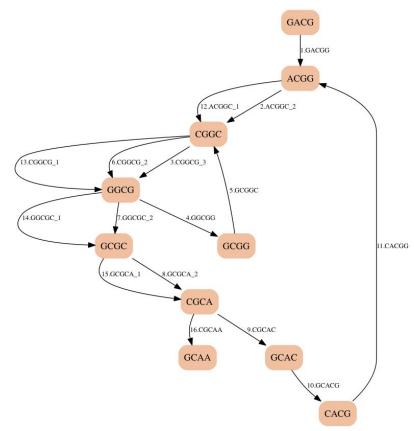

- There are many possible Hamiltonian Paths
- How do they differ?
 - There were two possible paths leaving any [CGGCG] node
 - $\blacksquare \quad [CGGCG] \rightarrow [GGCGC]$
 - $\blacksquare \quad [CGGCG] \rightarrow [GGCGG]$
 - A valid solution can be found down either path
- There might be even more solutions
- Genome assembly appears ambiguous like the Minimal Substring problem, but is it?

How about an Euler Path?

```
In [20]: ▶ k = 5
             target = "GACGGCGCGCGCGCGCGCAA"
             kmers = kmersUnique(target, k)
             print(kmers)
             nodes = sorted(set([code[:k-1] for code in kmers] + [code[1:k] for code in kmers]))
             print(nodes)
             G2 = Graph(nodes)
             for code in kmers:
                G2.addEdge(code[:k-1],code[1:k],code)
             path = G2.eulerianPath()
             print(path)
             path = G2.eulerEdges(path)
             print(path)
             seq = path[0][0:k]
             for kmer in path[1:]:
                 seg += kmer[k-1]
             print(sea)
             print(seg == target)
             ['ACGGC 1', 'ACGGC 2', 'CACGG', 'CGCAA', 'CGCAC', 'CGGCG 1', 'CGGCG 2', 'CGGCG 3', 'GACGG', 'GCACG', 'GCGCA 1', 'GCGCA 2',
             'GCGGC', 'GGCGC 1', 'GGCGC 2', 'GGCGG']
             ['ACGG', 'CACG', 'CGCA', 'CGGC', 'GACG', 'GCAA', 'GCAC', 'GCGC', 'GCGG', 'GGCG']
             [4, 0, 3, 9, 8, 3, 9, 7, 2, 6, 1, 0, 3, 9, 7, 2, 5]
             ['GACGG', 'ACGGC 2', 'CGGCG 3', 'GGCGG', 'GCGGC', 'CGGCG 2', 'GGCGC 2', 'GCGCA 2', 'CGCAC', 'GCACG', 'CACGG', 'ACGGC 1', 'CG
             GCG 1', 'GGCGC 1', 'GCGCA 1', 'CGCAA']
             GACGGCGGCGCACGGCGCAA
             True
```

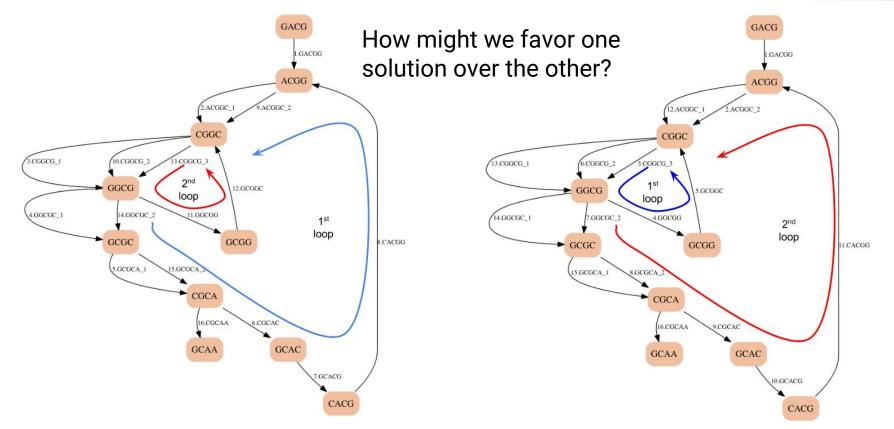

The k-1 De Bruijn Graph with k-mer edges

- We got the right answer, but we were lucky.
- There is a path in this graph that matches the Hamiltonian path that we found before

What are the Differences?

Choose a bigger k-mer

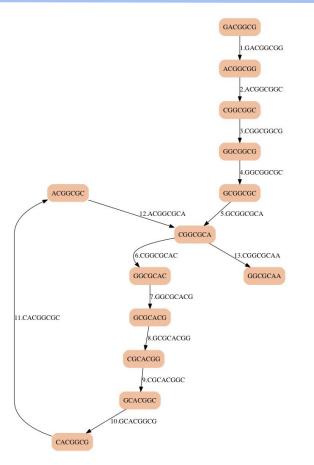

```
In [22]: ▶ k = 8
             target = "GACGGCGCGCGCGCGCGCAA"
             kmers = kmersUnique(target, k)
             print(kmers)
             nodes = sorted(set([code[:k-1] for code in kmers] + [code[1:k] for code in kmers]))
             print(nodes)
             G3 = Graph(nodes)
             for code in kmers:
                G3.addEdge(code[:k-1],code[1:k],code)
             path = G3.eulerianPath()
             print(path)
             path = G3.eulerEdges(path)
             print(path)
             seq = path[0][0:k]
             for kmer in path[1:]:
                 seq += kmer[k-1]
             print(seq)
             print(seq == target)
             ['ACGGCGCA', 'ACGGCGGC', 'CACGGCGC', 'CGCACGGC', 'CGGCGCAA', 'CGGCGCAC', 'CGGCGGCG', 'GACGGCGG', 'GCACGGCG', 'GC
            GGCGCA', 'GGCGCACG', 'GGCGGCGC']
             ['ACGGCGC', 'ACGGCGG', 'CACGGCG', 'CGCACGG', 'CGGCGCA', 'CGGCGGC', 'GACGGCG', 'GCACGGC', 'GCGCACG', 'GCGCGCC', 'GGCGCAA', 'G
            GCGCAC', 'GGCGGCG']
             [6, 1, 5, 12, 9, 4, 11, 8, 3, 7, 2, 0, 4, 10]
             ['GACGGCGGG', 'ACGGCGGCC', 'CGGCGGCGC', 'GCGGCGCCA', 'CGGCGCACC', 'GCGCCACGG', 'CGCACGGC', 'GCACGGCC', 'GCACGGCG', 'CA
            CGGCGC', 'ACGGCGCA', 'CGGCGCAA']
             GACGGCGGCGCACGGCGCAA
             True
```

Advantage of larger k-mers

Wax.

- Making k larger (8) eliminates the second choice of loops
- There are edges to choose from, but they all lead to the same path of vertices

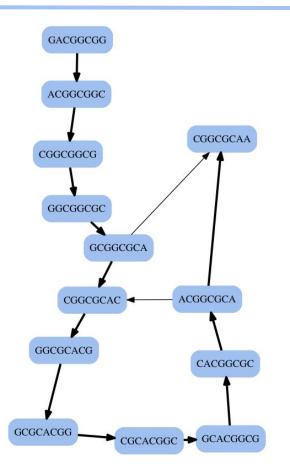

Applied to the Hamiltonian Solution

```
In [23]: ▶ k = 8
             target = "GACGGCGCGCGCGCGCGCAA"
             kmers = kmersUnique(target, k)
             G4 = Graph(kmers)
             for vsrc in kmers:
                 for vdst in kmers:
                     if (vsrc[1:k] == vdst[0:k-1]):
                        G4.addEdge(vsrc,vdst)
             path = G4.hamiltonianPathV2()
             print(path)
             seq = path[0][0:k]
             for kmer in path[1:]:
                 seq += kmer[k-1]
             print(seq)
             print(seq == target)
             ['GACGGCGG', 'ACGGCGGC', 'CGGCGGCG', 'GGCGGCGCC', 'GCGGCGCAC', 'CGGCGCACC', 'GGCGCACG', 'CGCACGGC', 'CACGGCGC', 'CA
             CGGCGC', 'ACGGCGCA', 'CGGCGCAA']
             GACGGCGCGCGCACGGCGCAA
             True
```

Graph with 8-mers as vertices

- There is only one Hamiltonian path
- There are no repeated k-mers

Assembly in Reality

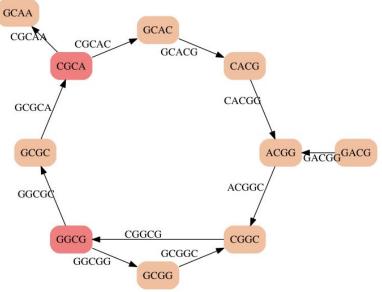

- Problems with repeated k-mers
- We can't distinguish between repeated k-mers
- Recall we knew from our example that were {2:ACGGC, 3:CGGCG, 2:GCGCA, 2:GGCGC}
- Assembling path without repeats:

There is no single Euler Path

Resulting Graph with "unique" 5-mers as edges

- But there are is a set of paths that covers all edges ['GACGGCG', 'GGCGGC', 'GGCGCA', 'CGCAA', 'CGCACGG']
 - Extend a sequence from a node until you reach 0 a node with an out-degree \rightarrow in-degree
 - Save these partially assembled subsequences, Ο call them *contigs*
 - Start new contigs following each out-going 0 edge at these branching nodes

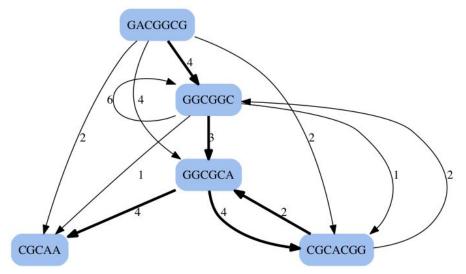

Next assemble contigs

- Use a modified read-overlap graph to assemble these contigs
- Add edge-weights that indicate the amount of overlap

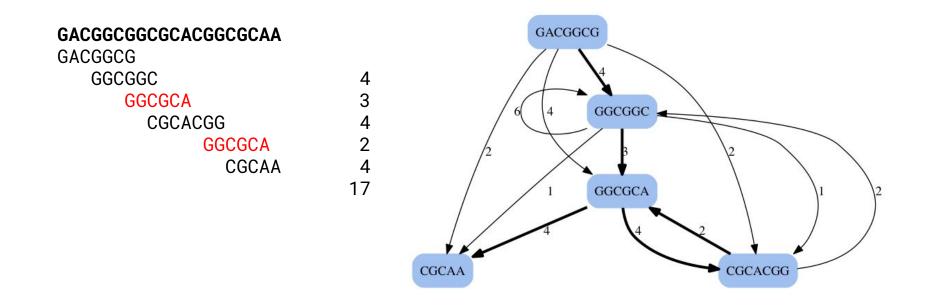

• Usually much smaller than the graph made from k-mers

A Heavy Path

Find the heaviest path touching all vertices in this smaller graph

Discussion

- No simple single algorithm for assembling a real genome sequences
- Generally, an iterative task
 - Choose a k-mer size, ideally such that no or few k-mers are repeated
 - Assemble long paths (contigs) in the resulting graph
 - Use these contigs, if they overlap suffciently, to assemble longer sequences
- Truely repetitive subsequences are a challenge
 - Leads to repeated k-mers and loops in graphs in the problem areas
 - Often we assemble the "shortest" version of a genome consistent with our k-mer set
- Things we've ignored
 - Our k-mers are extracted from short read sequences that may contain errors
 - Our short read set could be missing entire segments from the actual genome
 - Our data actually supports 2 paths, one through the primary sequence, and a second through it again in reverse complement order.
